Hospital return buyer guide

Gia Hospital Return Analytics is a hosted annual subscription. You subscribe on AWS Marketplace and Scienza runs the service. Nothing is deployed in your AWS account. Pilot is one cohort and 12 successful analyses for $36,000. Plan Pack is four cohorts and four quarterly successful analyses per cohort for $120,000, one per contract-relative quarter. Each cohort is up to 500 residents. A successful published report uses one analysis. The report is a model estimate of return to hospital from the facility within 90 days, summarized for the cohort. A hospital departure in that window is the event. Leaving by another route ends follow-up and is not counted as a negative. This is not a CMS 30-day readmission measure, not an inpatient-only measure, and not a post-observation measure. It does not claim outcomes after observation ends. It is not an individual clinical finding, and not a prevention benefit. This purchase is not the dementia listing, not the falls listing, not Cognitive Change, and not Gia Direct. This page states no performance number.
